Antelope User Group Meeting
Fairbanks, AK, USA

Host: Alaska Earthquake Centre (AEC)

Earth Natural Resources
Earth Natural Resources Canada

Natural Resources Canada opera et seismologues à Ottawa et study Canada's earthquakes. 1,000 séismes annuels sont enregistrés (environ), magnitude 2.5 en moyenne. Ces activités comprennent l'activité sismique, fluid injection, oil and gas exploration, mining and other activities around the earthquake location. Ils fournissent des informations sur les séismes et leur impact.

Most of the year 2015's seismic activity was active (previous year) earthquakes of magnitude 4 or greater than 6. Seven major earthquakes.

Most earthquakes in western Canada occur in the Cordilleran mountain system. This compression causes earthquakes including the eastern and Arctic mountain ranges, and the proto-Atlantic. The pattern of east

The largest earthquake in 2015 occurred on the coast. A magnitude 4.7 earthquake southern Vancouver Island, the los sources of which are not known. Earthquakes on several occasions from any of the earthquakes that occur.

Tremblements de terre / Earthquakes

SeismesCanada.nrcan.gc.ca

Ressources naturelles Canada sismographiques étendus à travers la Commission géologique du Canada et le temps de l'ère préhistorique dans le pays - de magnitude 1.0 au sud-est, 1.5 au nord et 2.0 au sud dans le sud du Canada et dans le sud du Grand Nord. En 2015, 5342 événements sont inclus parmi les événements induits par l'activité humaine, de l'exploitation minière et de la construction (points verts).
Ensuite, nous avons intégré des informations qui nous permettent de préciser la localisation des événements (coordonnées).

La plupart des tremblements de terre sismique était déjà connu par des cercles gris ouverts. Il y a une grande activité sismique récente dans le rapport de 78 tremblements d'Est.

La plupart des tremblements de terre sont causés par la compression du continent et le renouvellement des îles canadiennes et des îles établies anciennes. Parmi ces derniers il y a des millions d'années et jusqu'à 1000 ans dans l'Atlantique.

Le plus grand tremblement de Colombie-Britannique le 24 mai 1949, la côte nord de la Colombie-Britannique le 26 juillet 1949 et le 27 juillet 1949 que le nord de l'État de Washington est secoué par des petits et moyens tremblements de terre jusqu'à 1950.

Update

- Background: 2 offices ~3500 km apart
 - West: Victoria (Sidney), British Columbia (Antelope)
 - East: Ottawa, Ontario (legacy system)
- Network refurbishment: 5 yr project, new field instrumentation. Year 2 of project, site deployments commence.
- New stations: Increasing # of TA stations in Yukon Territory.
- Dataflow essentially the same, except for Analyst review dataflow.
- 2 new analysts in Ottawa office, using Antelope.
 - Means an eastern (new) and a western (pre-existing) catalogue.
 - Western (Sidney) office has used Antelope since 2006 for event location. Stand-alone analysis machine (v4.11) will transition to part of main dataflow structure (v5.6).
 - Eastern office will officially transition to Antelope (v5.6) for event location, commencing Sept/Oct.

Upcoming Challenges

- Some dataflow tweaking: station/channels used for site monitoring and automatic locations are not necessarily identical to those wanted/needed for analysis (catalogue creation).
 - E.g. omit SOH channels, GSN stations, some of the other external network stations.
 - Re-tuning event locations to reduce false events and catch missing events.
- Partitioning analysis work (teleseismic events) between the 2 offices/catalogues to avoid duplication.
- Deciding on common event type designation for the two catalogues.
- Combining the 2 catalogues to produce a final catalogue for web display and catalogue search. On the fly requirements:
 - Create virtual catalogue more than once a day (perhaps as much as every 10 minutes?).
 - Real-time catalogue, monthly catalogues for each office.
 - Removing un-reviewed events and arrivals.
 - Determining authoritative agency for events with more than one origin or arrivals (local & teleseismic duplicate events).

Upcoming Challenges (cont.)

- Potential event location/catalogue coordination with AEC (AK) and ANF (TA) in Yukon Territory.
- As yet unanticipated problems....
