

Focal Mechanism Framework in Antelope

Antelope Users Group Meeting 2016
August, 17 - 19 – Fairbanks, Alaska

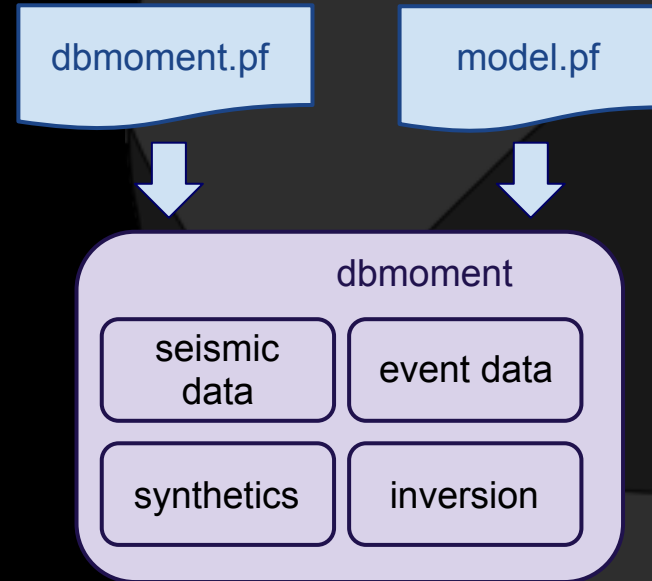

Juan Reyes
reyes@ucsd.edu

Introduction

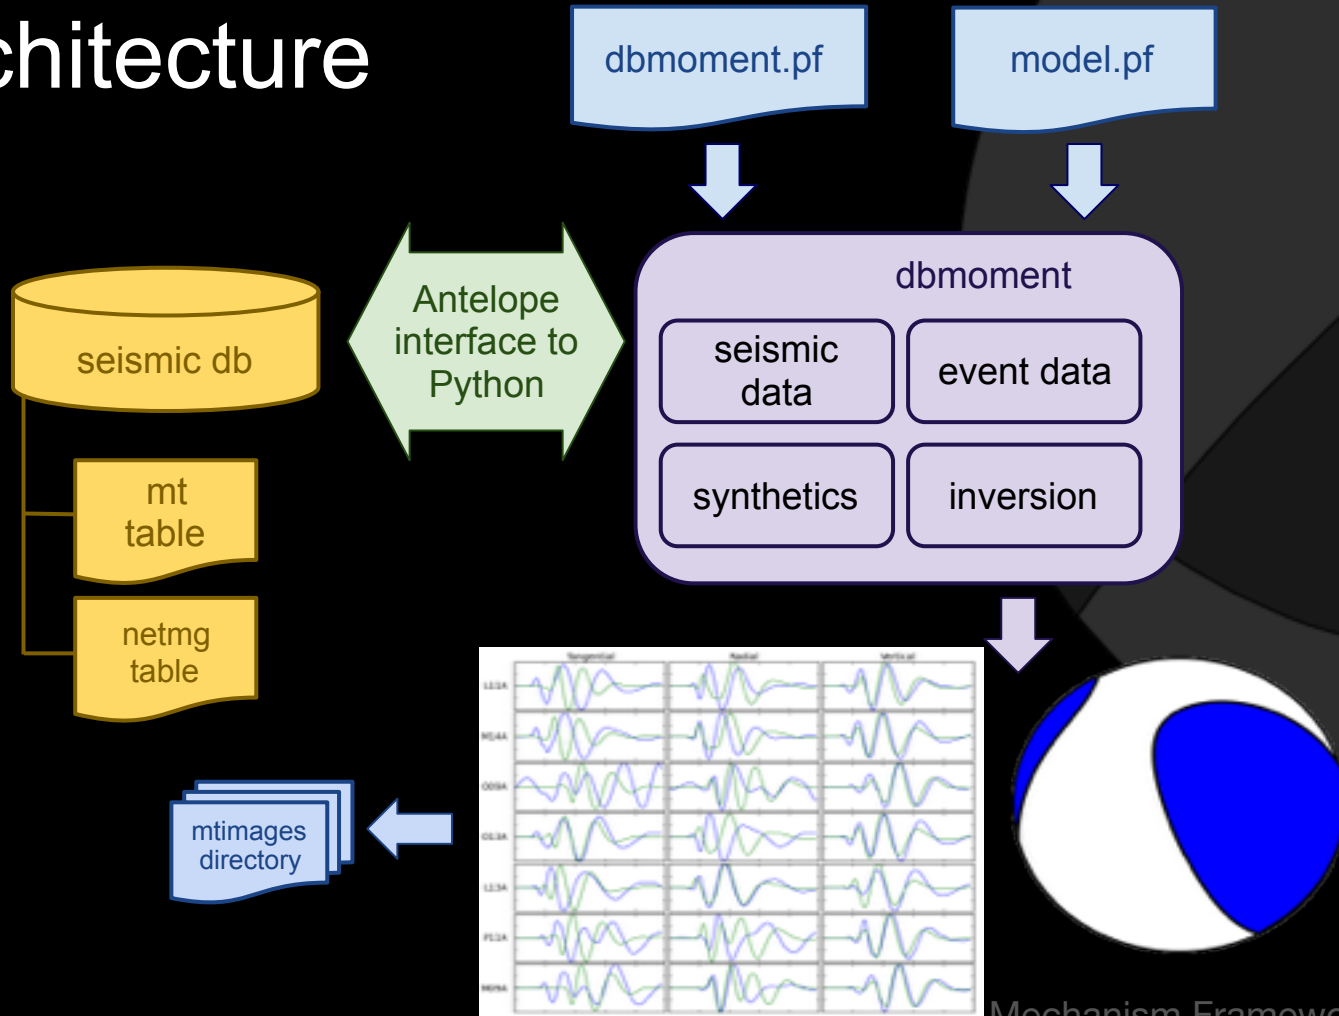

The time domain seismic moment tensor inversion software package written by Dreger has been packaged for inclusion into the Antelope Environmental Monitoring System. The new infrastructure was written natively in Python language.

Architecture

Internally, our code has been designed to be as modular as possible. The configuration parameters got consolidated and simplified. Unavoidably every seismic region will require a dedicated velocity model.

Architecture

Database Requirements

The code requires some information about the stations, the event(s) that will be processed, and the actual data files. The list of tables that are required by the code:

arrival

assoc

event (if running with the **-e** flag)

instrument

netmag

origin

sensor

site

wfdisc

The code will later update the ***netmag*** and will update (or create) an ***mt*** table with results. There will be a directory with synthetic traces with a different ***wfdisc*** table than the original data.
