

Zentralanstalt für Meteorologie und Geodynamik

Antelope usage at ZAMG

European Antelope User Group Meeting 2012

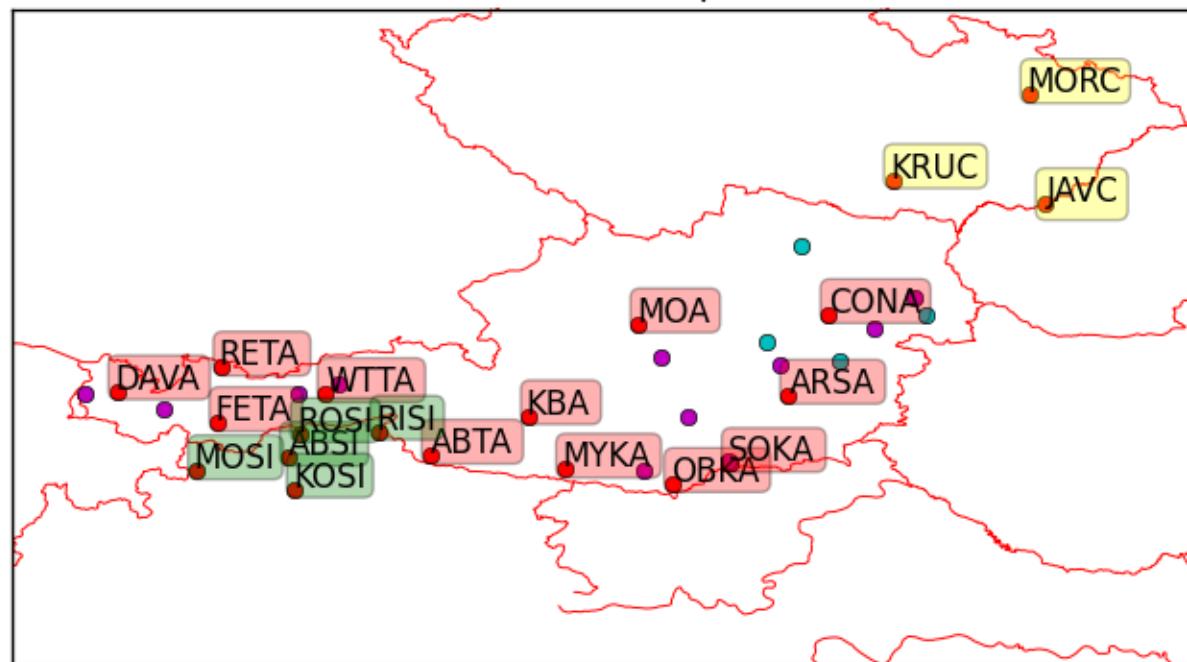

Trieste, Italy

February 23 & 24

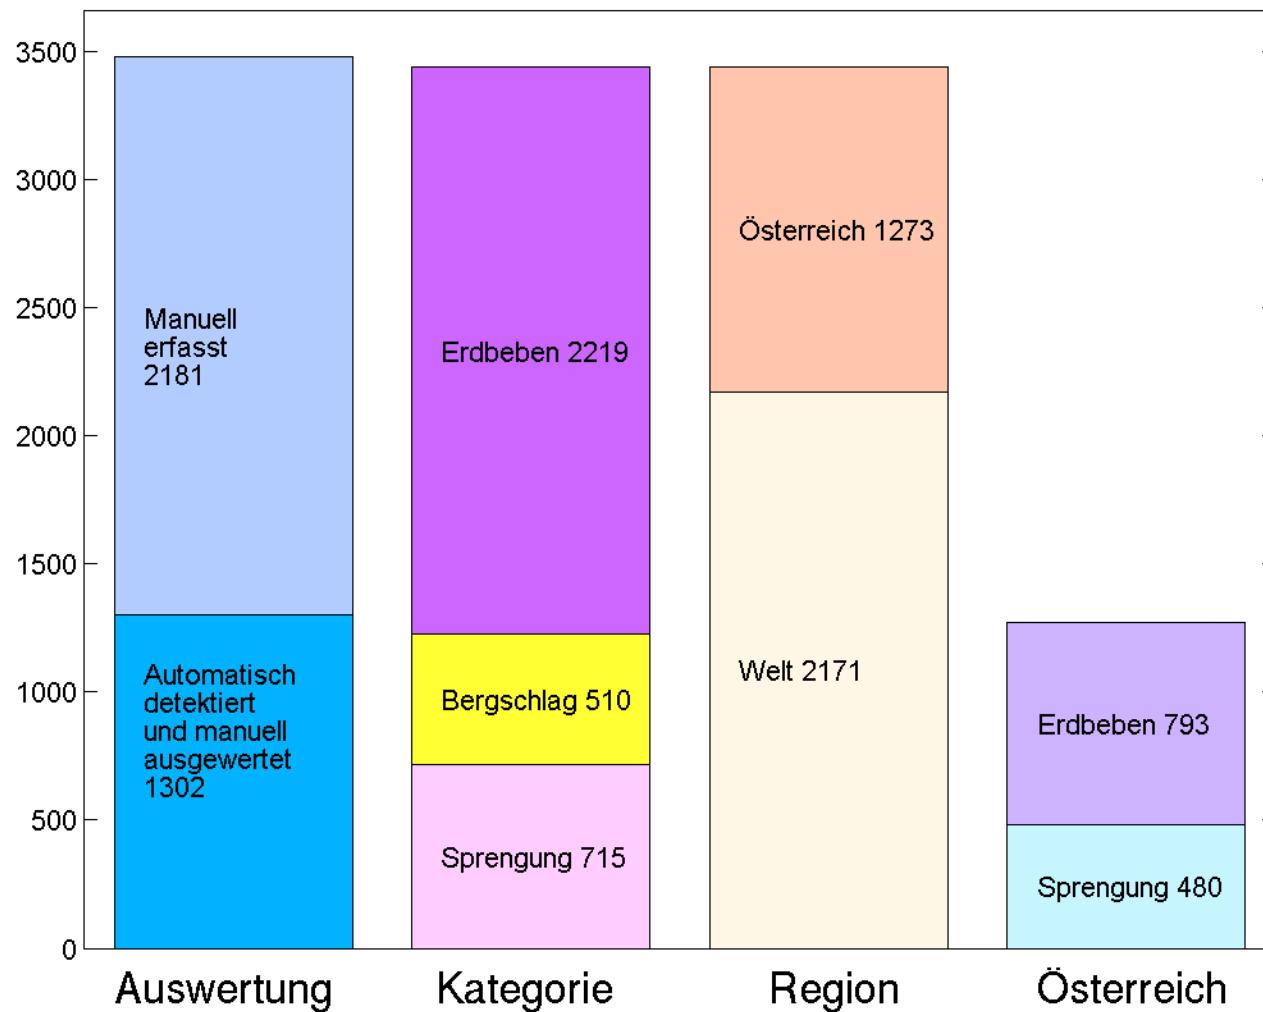

Nikolaus Horn
ZAMG / Vienna

network

Station Map

Beben-Statistik für den Zeitraum zwischen 20100101 und 20101231

tasks - bulletin

get external databases

EMSC, USGS, CTBTO, neighbours

still no eventORB I am not allowed to run an open
orbserver

dbfix_phase

reassociate to revised solutions

send_bulletin, send_reviewed_bulletin

Specific Bulletins

kelag2csv – gather k2header information for a site

waveforms

cdorb2db, db2msd

compare to orb2d

- foreign stations with cdorb2db - very stable now!
- „own“ stations with orb2db
- triggered data with orb2db, i3 format to make a difference

copy of wf directories to nfs storage

modified rtbackup to keep netcode

events

dbsplit into annual volumes

db2AEC

k2evtinfo2db

distribute database across servers with dbnew2orb

realtime update with manual relocations

safe in realtime applications

relies on IDs

relies on Iddate

main problem is to delete events

solution is to use rtorbcm with remote scripts

a similar script is used for on-duty remote relocations

might still be interesting to go without IDs

one dbbuild batchfile for each station
append history to file

foreach ff (*-dbb)
 dbbuild -b \$DB \$ff
no problems with ids (but looking forward to css3.1)

try to collect dbbuild batchfiles

rebuilding foreign stations with dbbuild most of the times better
than using SEEDfiles

CTBT stations from Geotool dbmaster, calib from somewhere else
if possible

cd1.12orb (

autodrm2db,

some modifications needed for ctbt

- ontime/offtime
- format violations
- displacement/velocity issue with autodrm

autodrm_proxy

mail_parser → reb2db, rr2db, rrx2db

w4u2db – parse swiss waves4u webpage to database

request data based upon availability, server-specific requests

Infrasound?

hydroacoustic??

RN???

data exchange

separate data exchange server
backup exchange server
redundant exchange scenarios?

redundant proxies, orbxchange

my homegrown isfbulletin vs db2ims

dborigin2orb with archive flag could be helpful

existing hardware

zagsun10	Enterprise 450	Server, old stuff	zagndc1	Netra T1	Data exchange
zaglsmon	PC	Nagios	Zagndc2	V240	
zagsun19	V240	Webserver	zagsun12	Netra T1	email, proxy
zagsun20	V440	Server	zagsun22	V240	
zagsun2	T5220	SunRay	zagsun14	Netra T1	email, proxy
zagsun26	T5220	Webstuff	zagsun24	V240	
iscsi raid	Storagetek 2510		zagsun16	V240	main antelope
iscsi raid	Storagetek 2510		zagsun15	V240	backup
zagsun27	M4000	Computing	Zagls01	PC	samba, nfs
			Raid	TT6100	waveforms
			Raid	TT6100	other archive
			Raid	Brownie	dead now
zagmac1	MacPro	only analysis workstation	zagls02	PC	alternate server samba, nfs
zagsun17	Analysis	fading away	Raid	TT6100	waveforms
zagsun13	NDC Analysis gone		zagls03	PC	
zagsun18	Observatory Server		Raid	TT6100	waveforms
zagsun28	Observatory Analysis				
zibk-xlwz	Innsbruck Analysis, Display		zaglsmon	PC	Nagios

hardware needed

2 servers for acquisition / processing (would a Mac mini do?)

2 analysis workstations (macpro needed)

1 or 2 data exchange servers (not really demanding tasks)

webserver and other commodities

storage

in terms of computing power, we only need 2 good machines!

interactive analysis

the rest

hardware

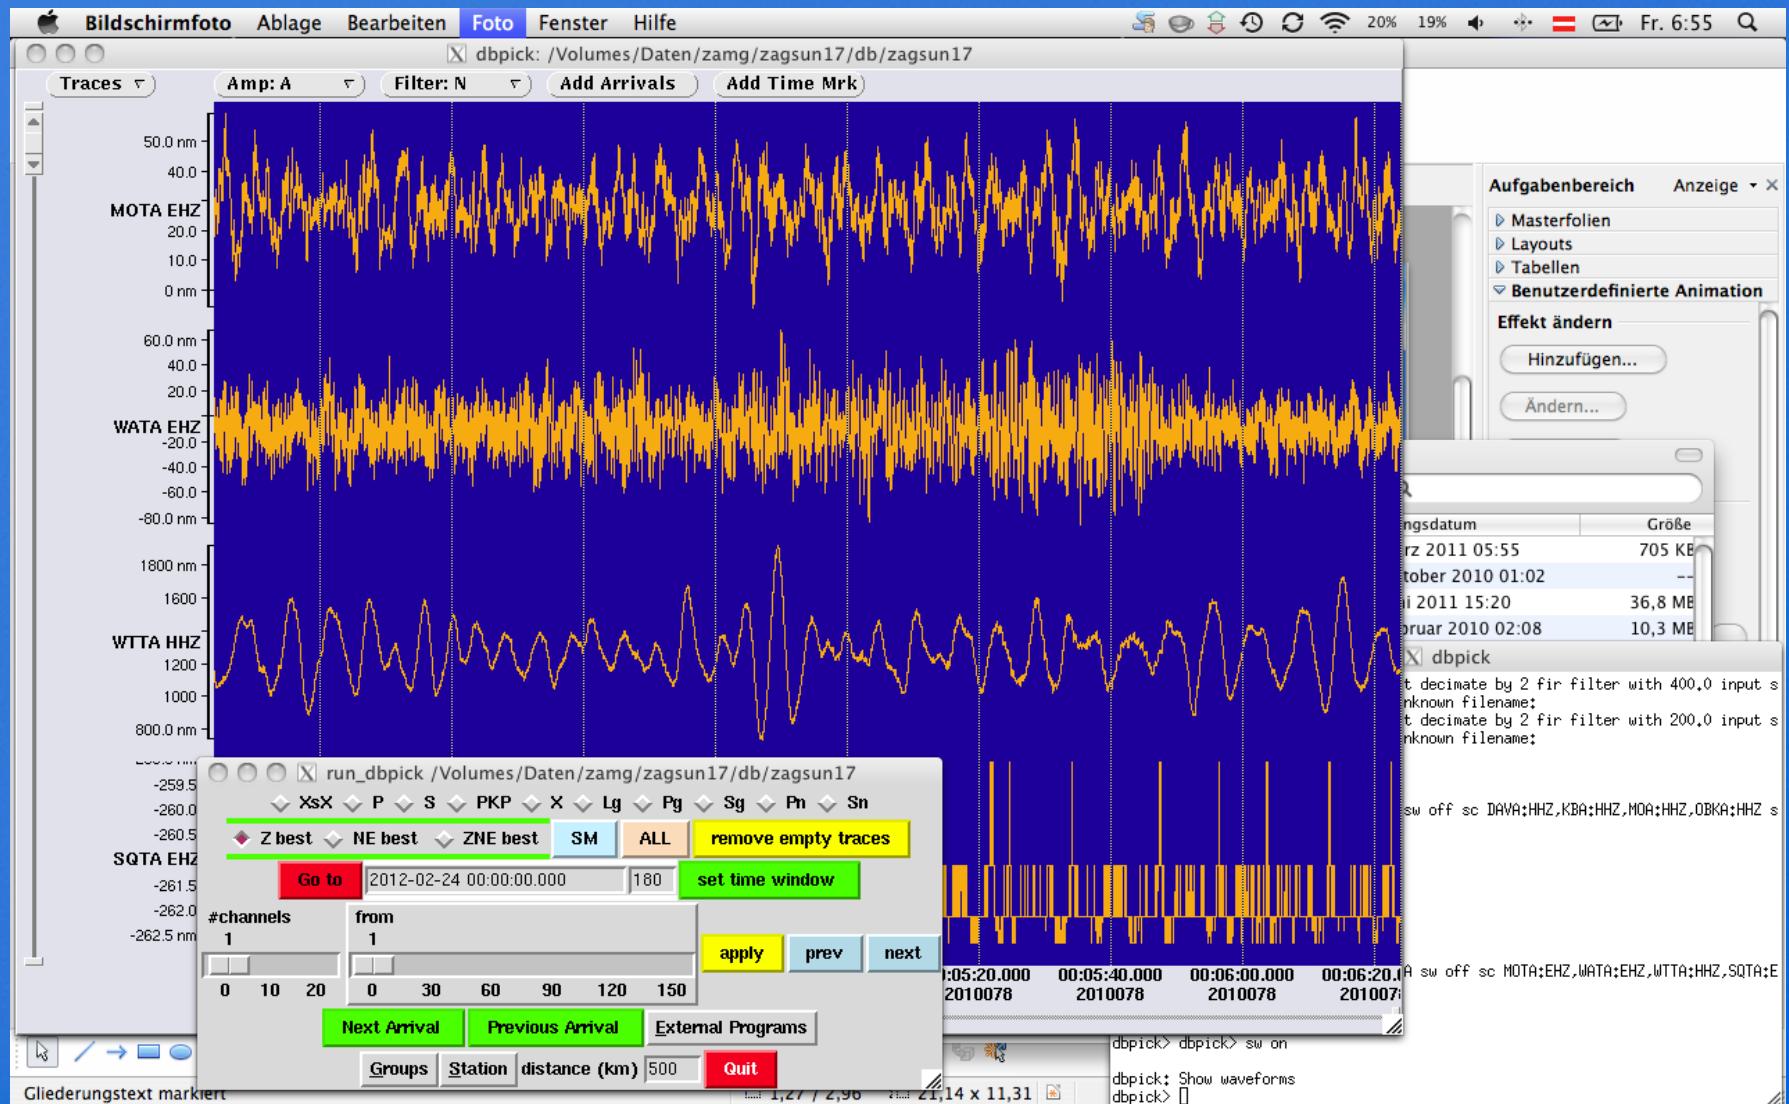

3 standard rackmount PCs running Debian
several external SATA raid with 16 disks each, RAID 5, 2 Hot-Spare
aging – last week primary node died after 8 years of operation

software

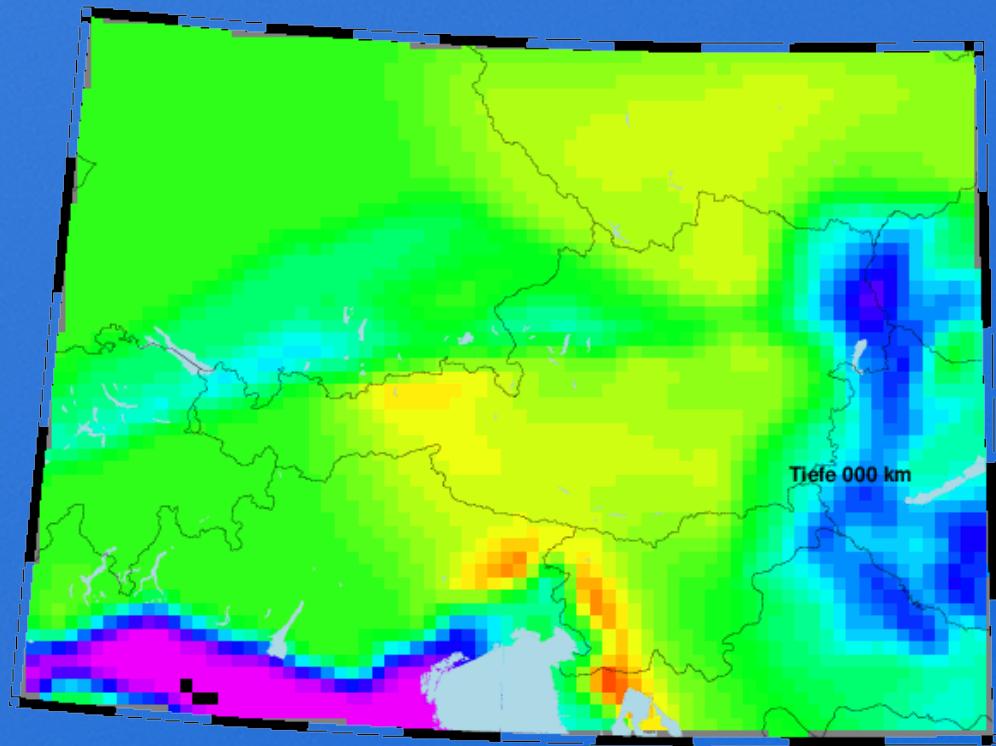

Debian or any other Linux
DRBD (<http://www.linbit.com>)
SAMBA, NFS, IDs from Windows domain controller
depending on the data, 2 or 3 way mirroring

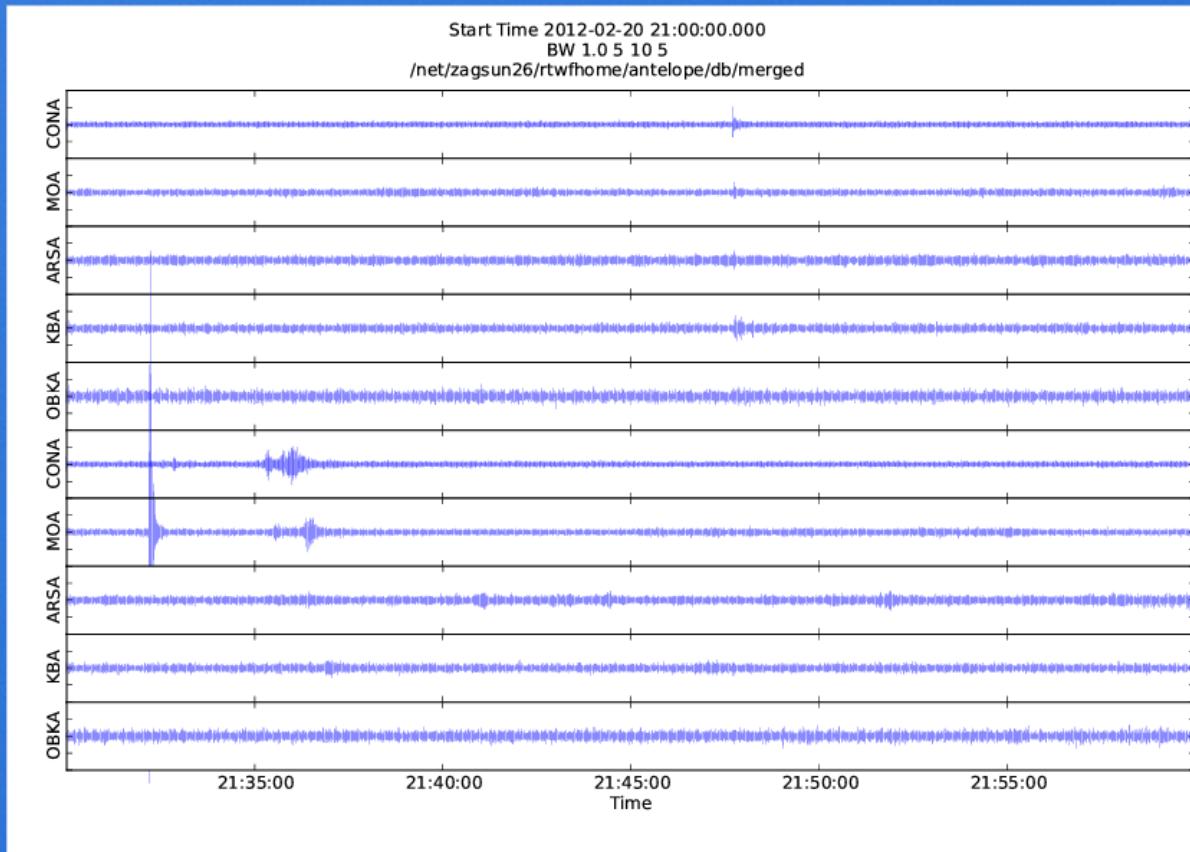

run_dbpick

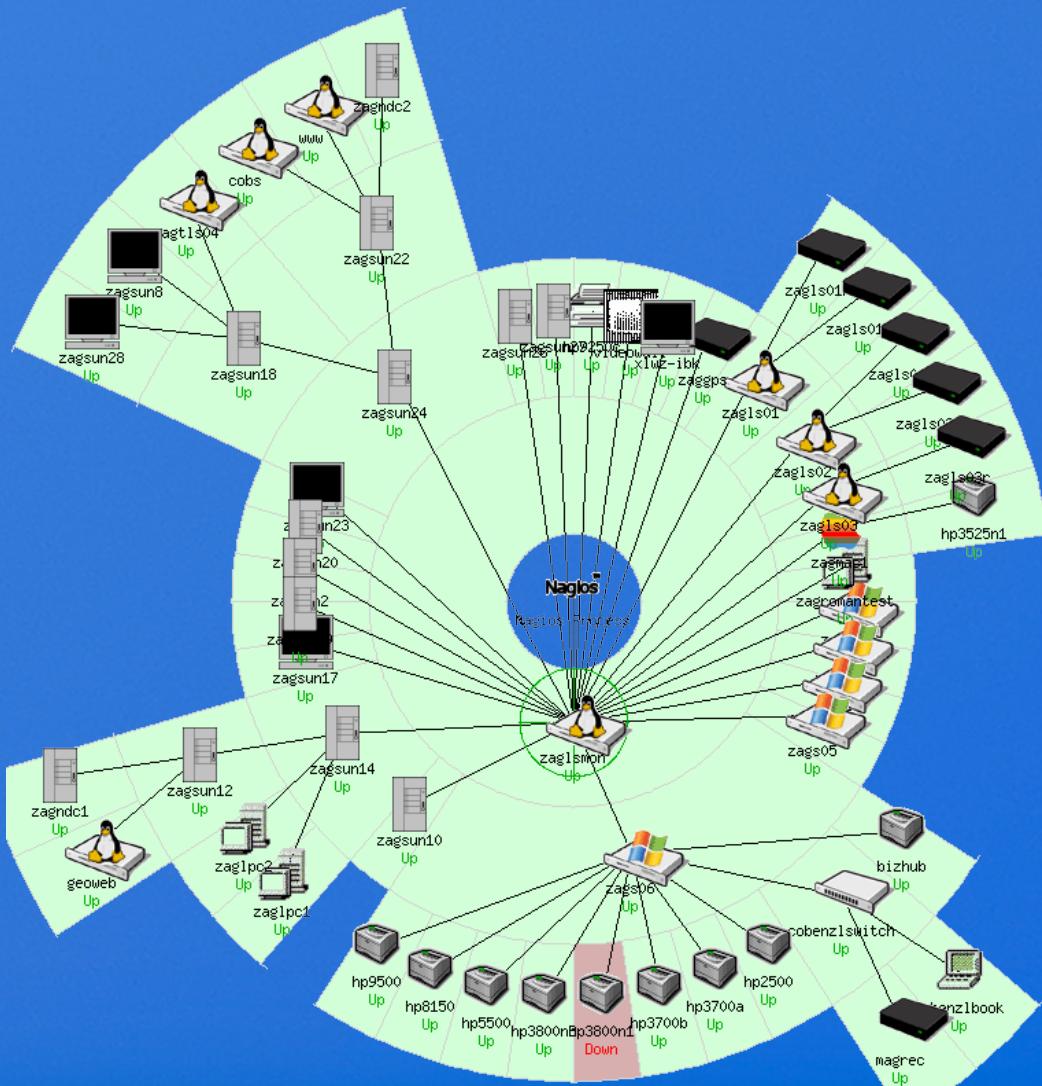

3d-Model

python waveform plotting

Nagios

excessive usage of NRPE –
might be better to use
distributed monitoring

simple check for orbstat
was needed

checking webpages is easy

currently we monitor stations only by waveform availability

icons seem to be important

things we are working on

finding the last origin-netmag problem will still take along time

webstuff, flexible replacement for dbrecenteqs

- waveform plotting,
- mapping

db2sql, db2pgsql, later even sql2db

email/alerting charset issues

more monitoring

more workflow into databases

- database consolidation

wishes

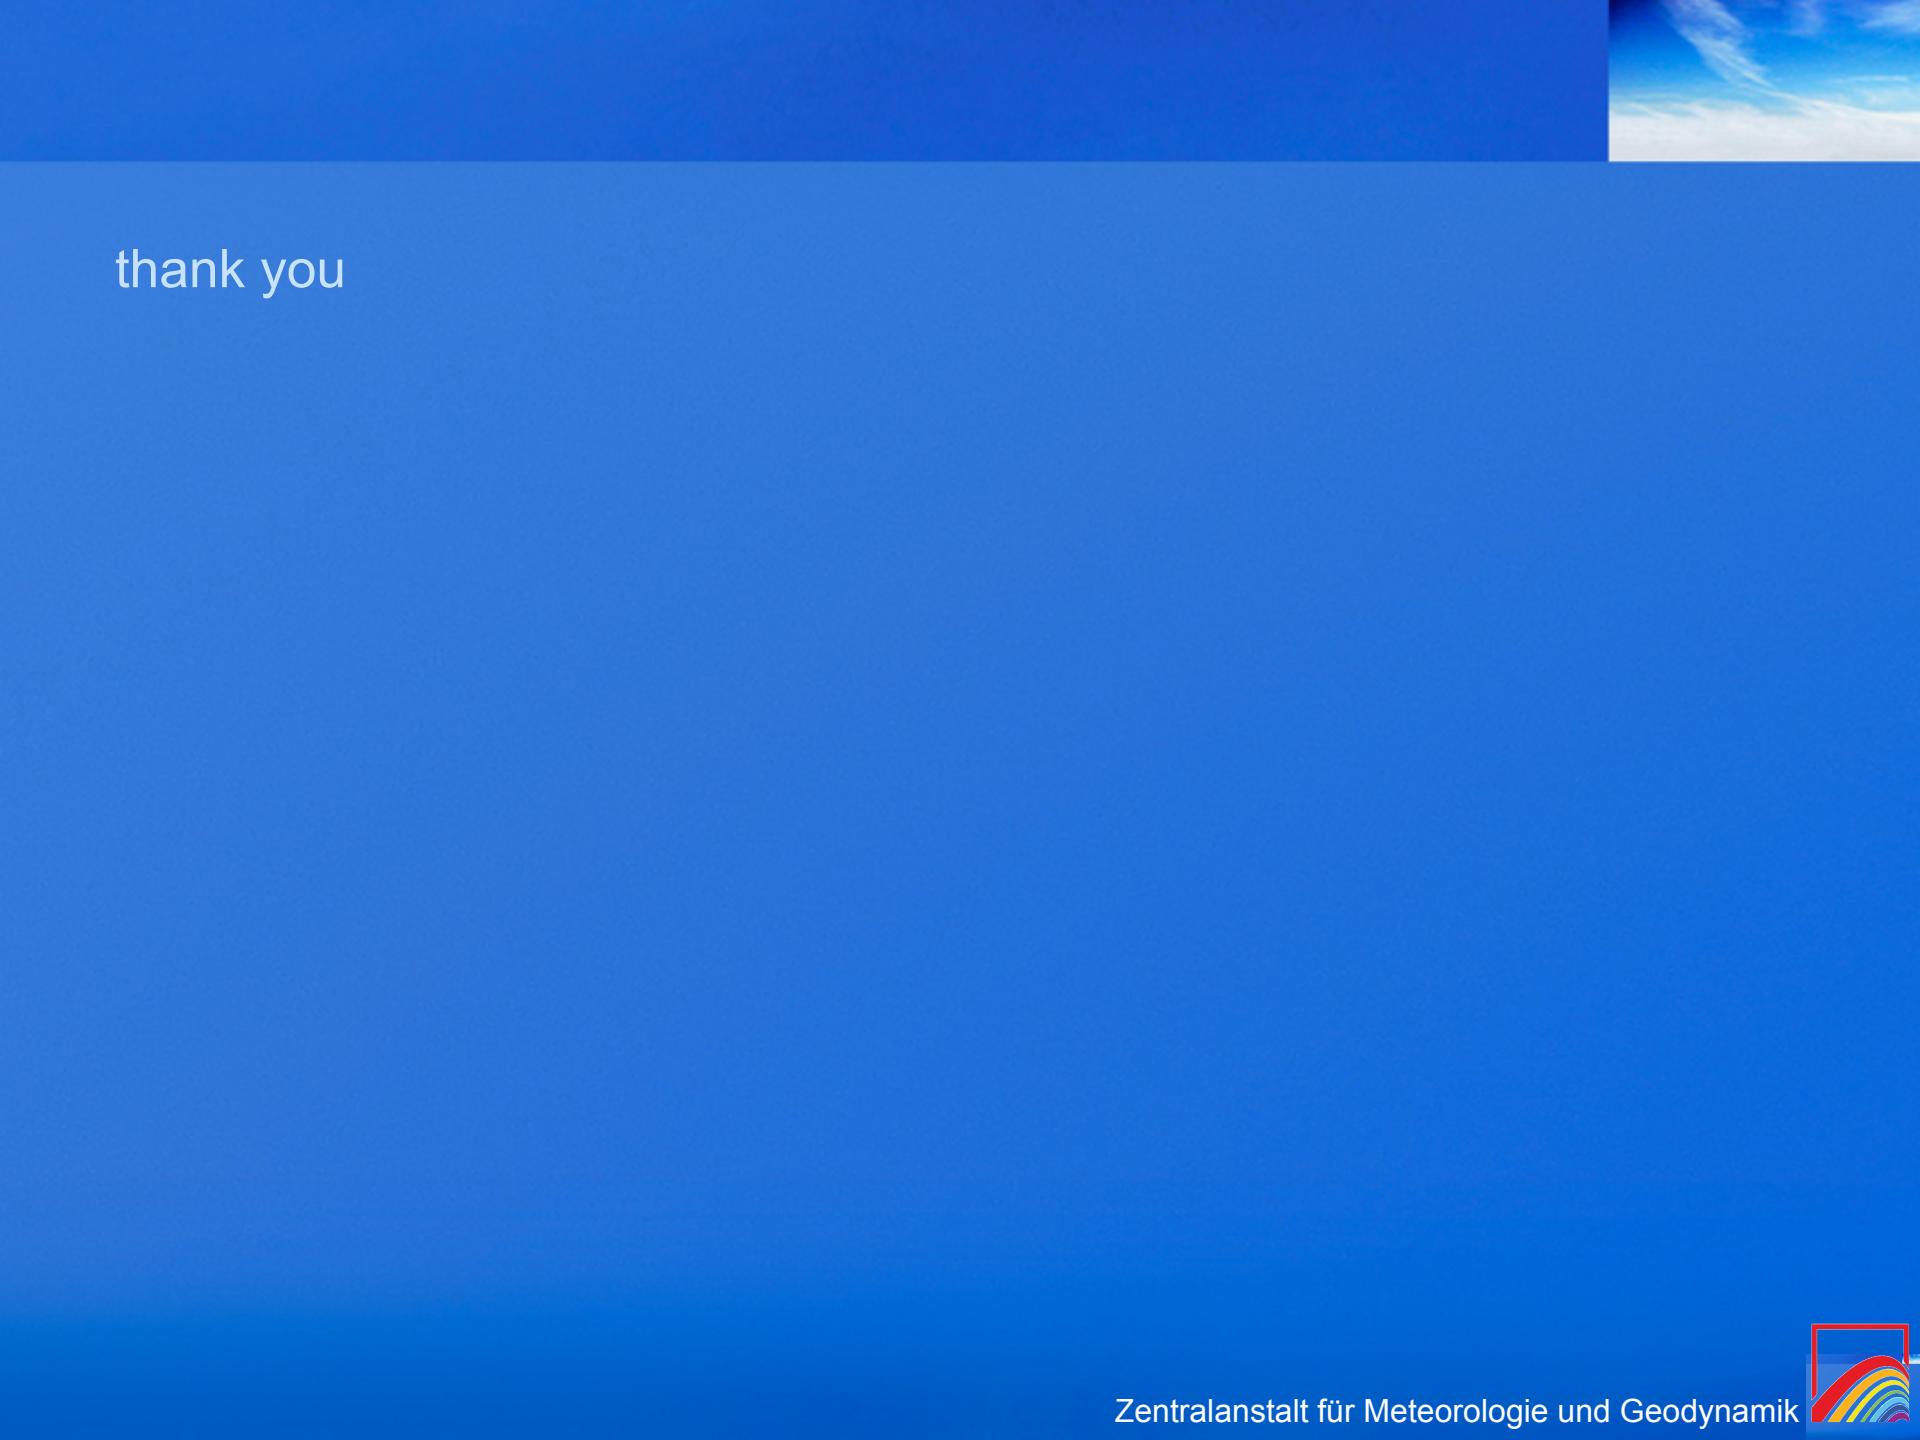

looking forward to new dbpick

Python on Suns

maybe more acquisition from „alien“ instruments

thank you
