

Preliminary Results of the Moment Tensor Code in Antelope

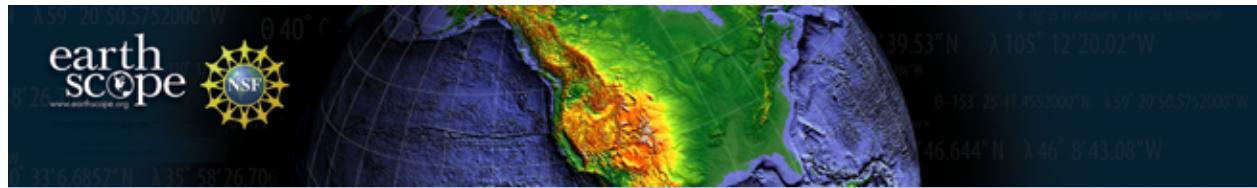

Antelope Users' Group Meeting
University of Nevada Reno Campus
October 23-25, 2012

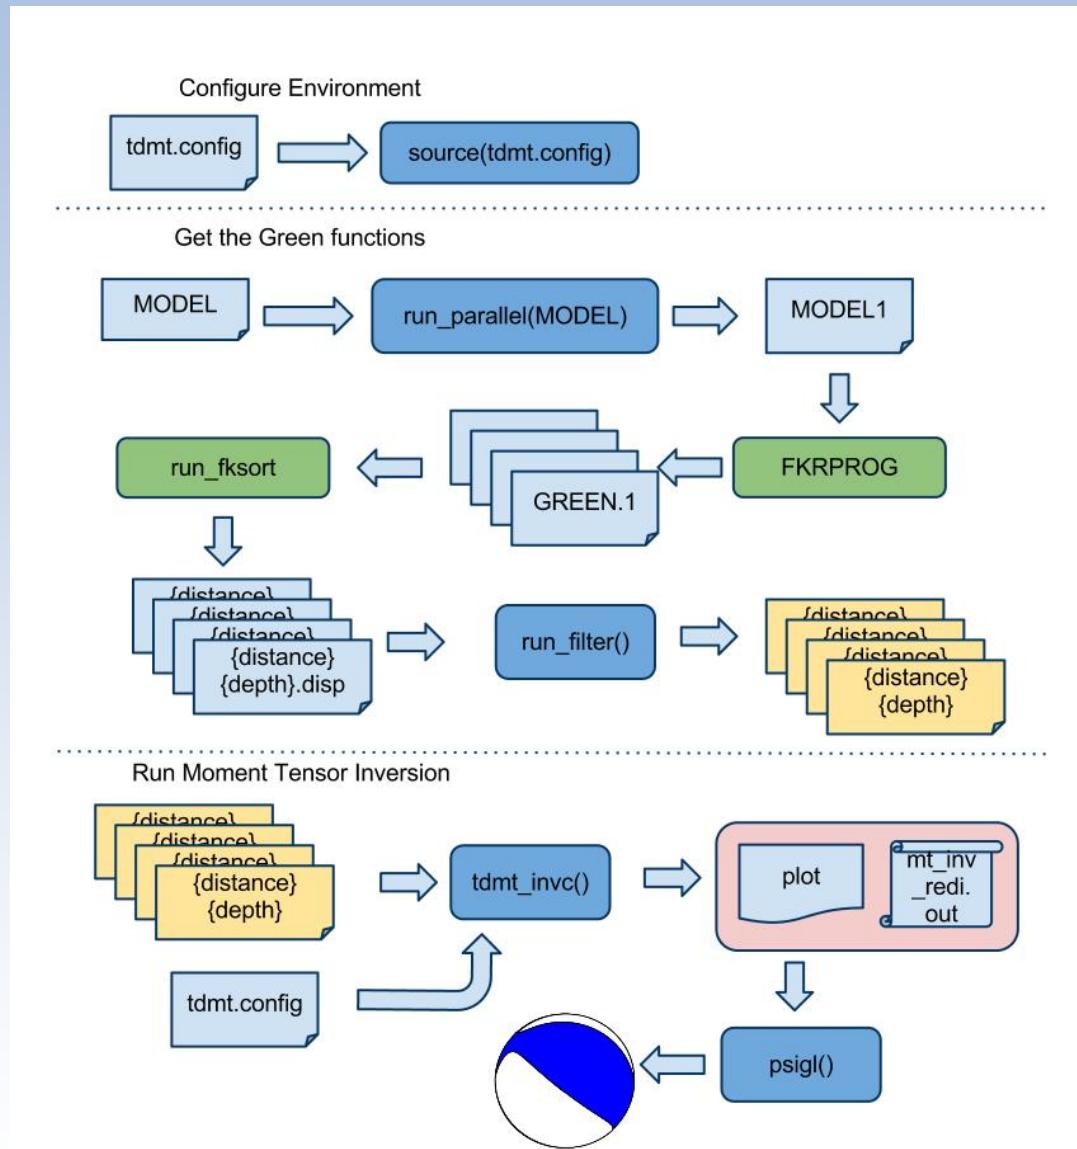

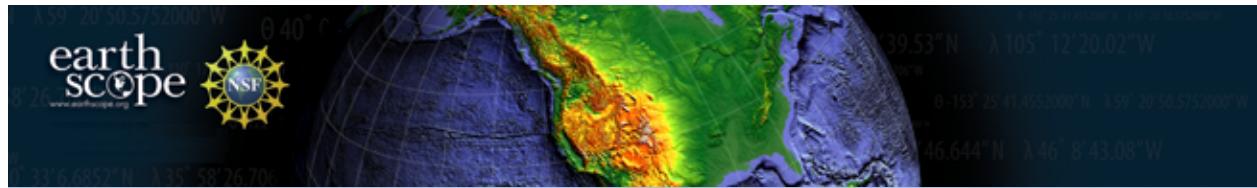

Completed Work

- Get origins from Datascope tables.
- Subset stations in quadrants.
- Get Green's Functions from Datascope based on distance and depth of event.
- Extract, rotate and filter data from stations.
- Reject stations with bad cross-correlation.
- Invert the MT and extract the eigen values/vectors.
- Update Datascope with results.

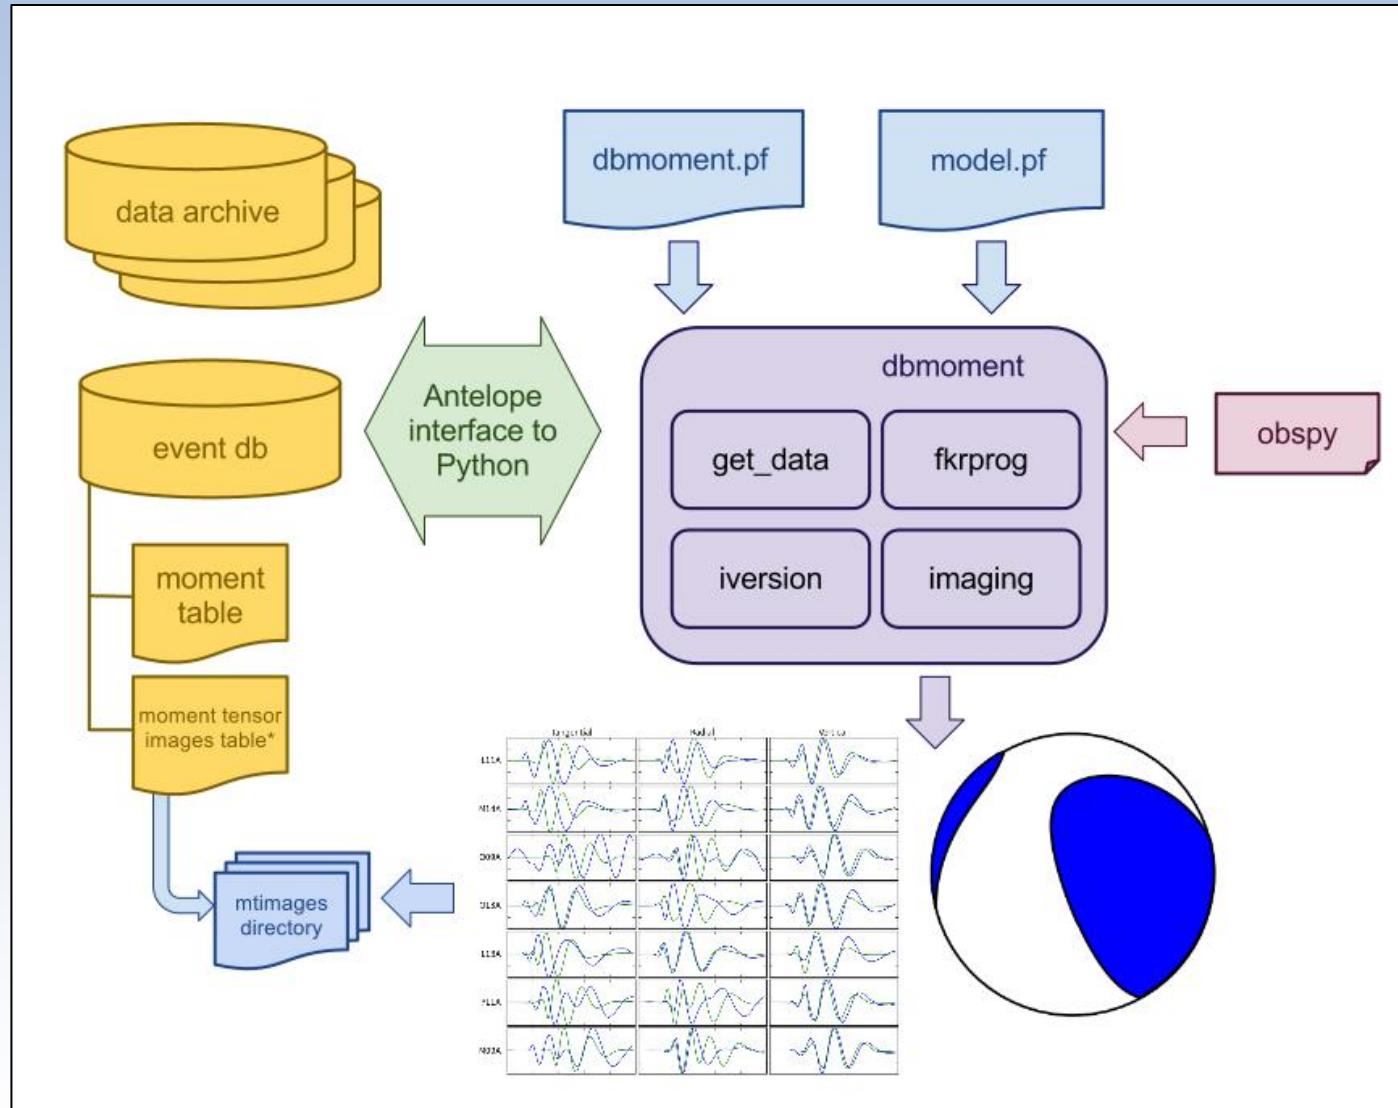

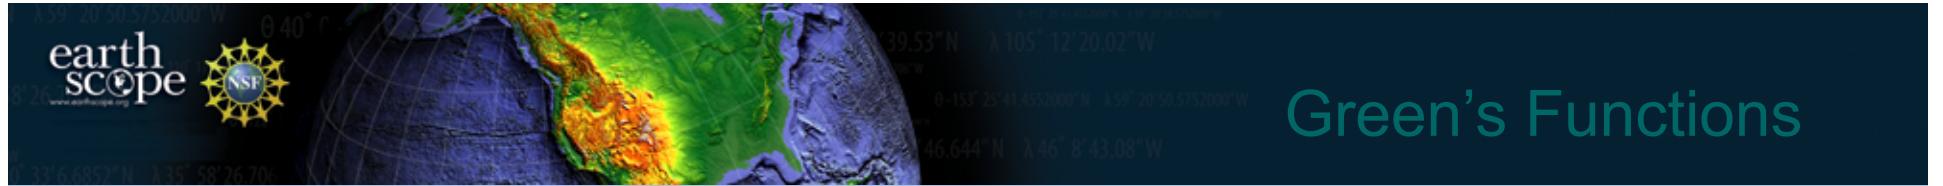

Previous Model

Current Model

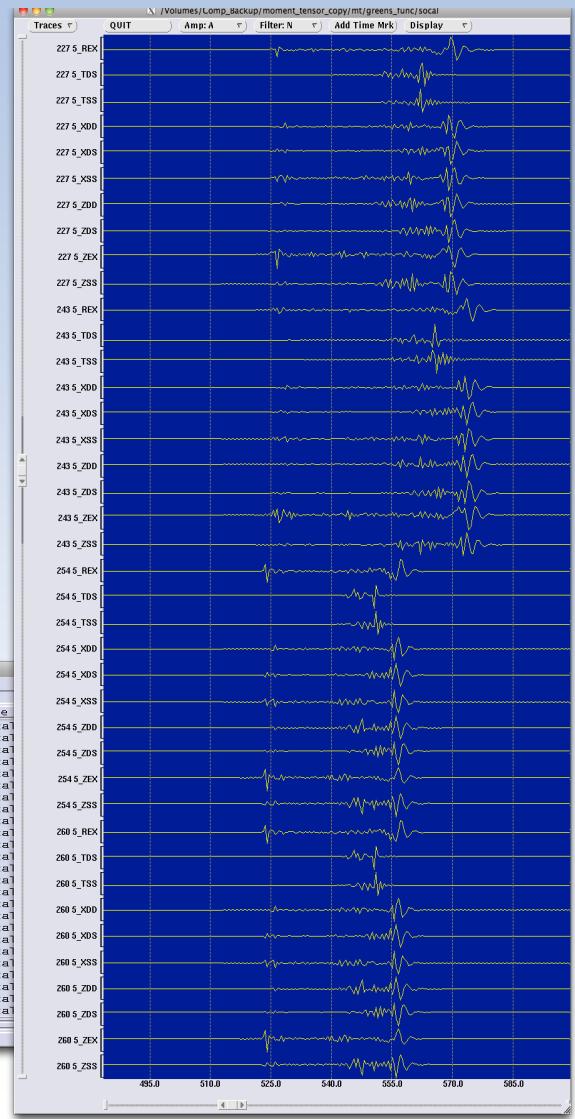

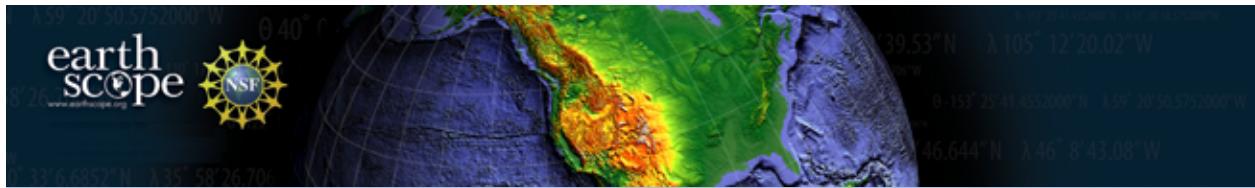

Green's Functions

Green's Functions are build dynamically upon request if not already present in archive. Newly constructed functions are stored on a database referenced by a wfdisc table.

socal wfdisc

        """ 22 lines: -----"""

```

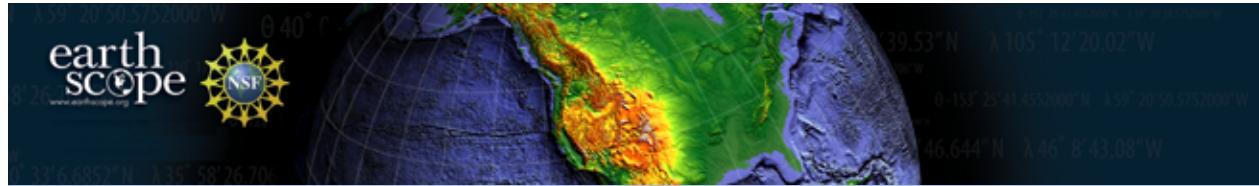

Installation & Execution

1. Download from Github
2. Install any additional libraries (ObsPy)
3. Build the contributed code source
4. Configure the command for your system by editing the Antelope configuration file (dbmoment.pf) - Run the executable dbmoment with the following options:

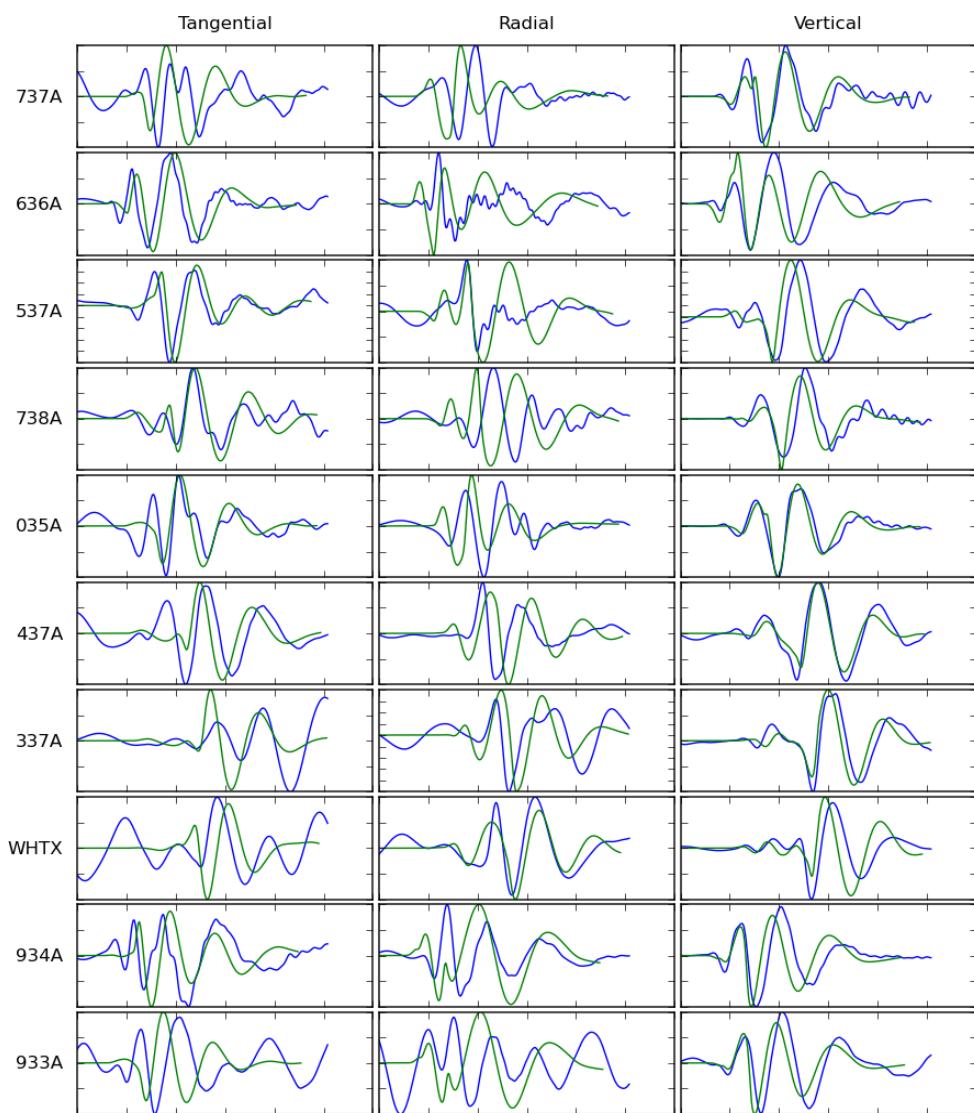

Usage: dbmoment [-vVde] [-p pfname] orid

Options:

- h, --help
- v, --verbose
- V, --veryverbose
- d, --debug
- p PF, --pf=PF
- e EVENT, --event=EVENT
- s SELECT, --select=SELECT
- r REJECT, --reject=REJECT

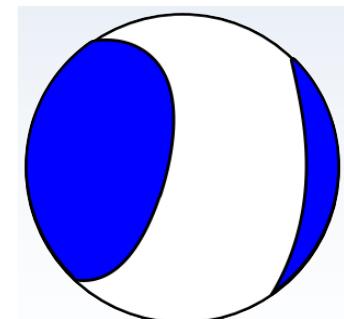

Results

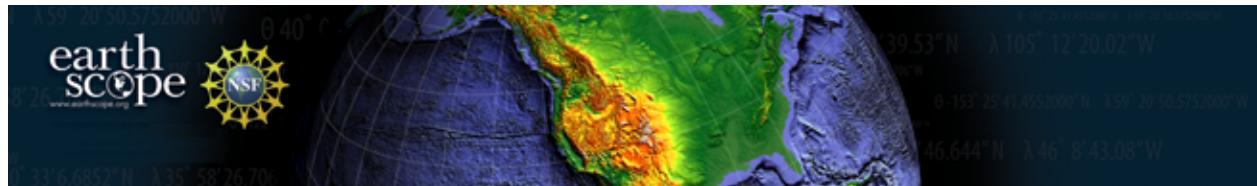

```

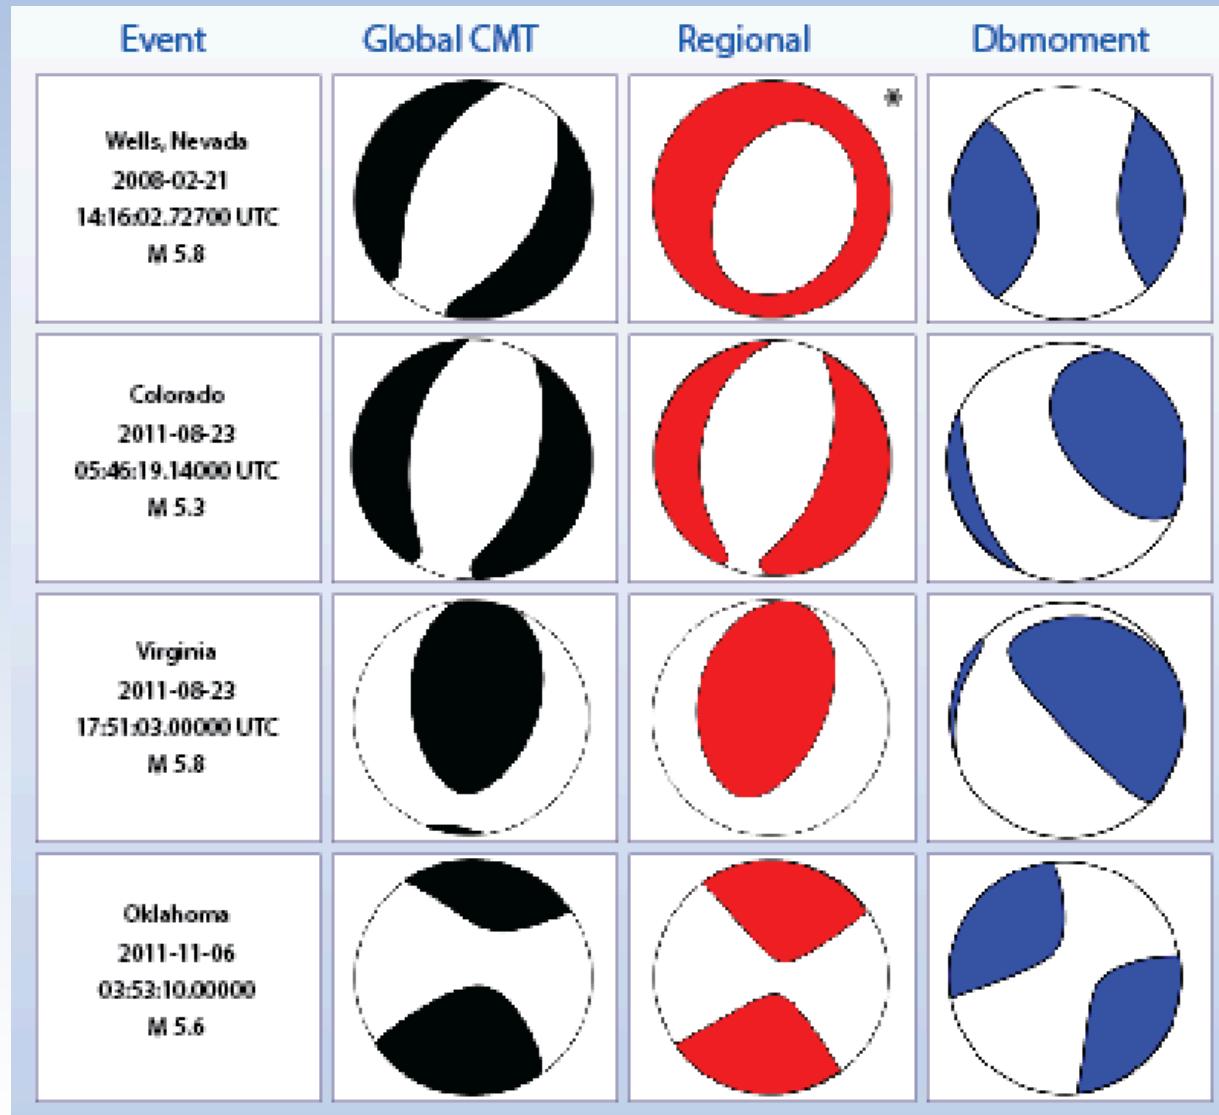

orid = 3830971
time = 10/20/2011 12:24:40
Strike 1 = 78
Rake 1 = -72
Dip 1 = 72
Strike 2 = 211
Rake 2 = -137
Dip 2 = 24
Mo = 1.340E+23
Mw = 4.718
% DC = 28.644
% CLVD = 71.356
% ISO = 0.000
VR = 3.624E-09
VAR = 3.624E-09

```
