Web Services (WS)

- What:

A software system designed to support machine to machine interaction **over a network**

- Why:

Interoperability between distributed systems over the internet/intranet

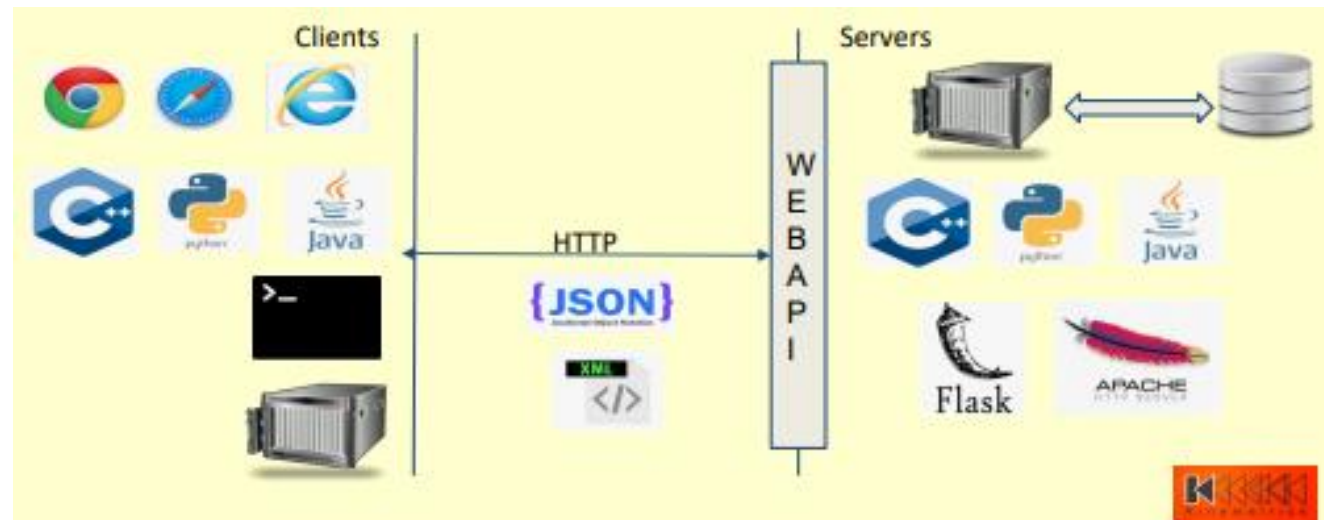

- How:

A web technology (**HTTP**) is used to transfer machine-readable file formats (**XML/JSON**) through a well-defined interface (**REST/SOAP**)

Web Services (WS)

- Main advantages:

- Decouple client implementation from server implementation
- Easy and standardized data access
- Service description information over WADL

From Rohan Ambli presentation, AUG Meeting 2019

FDSN Webservices

- **Specifications:**

- FDSN WS specification defines common characteristics of RESTful WS interfaces *“for the exchange of time series data, related metadata, event parameter and other data within the context of the International Federation of Digital Seismograph Networks (FDSN)”*:
 - Calling pattern
 - Service path and port
 - Common service methods
 - Minimum functionalities
 - Request URI construction
 - Common service responses and parameter characteristics
- Full specifications available at <http://www.fdsn.org/webservices/FDSN-WS-Specification-Commonalities-1.2.pdf>

FDSN Webservices

- Main services for data export:

<code>station/</code>	access to station metadata in FDSN StationXML and other formats
<code>dataselect/</code>	access to time series data in miniSEED and other formats
<code>event/</code>	access to contributed earthquake origin and magnitude estimates (QuakeML and other formats)
<code>availability/</code>	access to time series data availability

Examples: <http://service.iris.edu/fdsnws/station/1/query?network=IU&station=COLA&level=channel>
<http://service.iris.edu/fdsnws/dataselect/1/query?network=IU&station=COLA&starttime=2012-01-01T00:00:00&endtime=2012-01-01T12:00:00>
<https://service.iris.edu/fdsnws/event/1/query?starttime=2012-01-01T00:00:00&endtime=2012-12-31T23:59:59&minmag=6&format=text&nodata=404>
https://service.iris.edu/fdsnws/availability/1/query?format=text&net=IU&sta=COLA&orderby=nslc_time_quality_samplerate&includerestricted=false&nodata=404

Webservice implementation in Antelope

- Data export handled by **webservice_fdsn(1)** module:
 - station/ service based on **db2stationxml(3)**
 - event/ service based on **event2qml(1)**
 - dataselect/ service based on **trexcerpt(1)**
- Data import:
 - Available only for time series data (via *curl*, Web UI, Obspy Python package)
 - Need for a **stationxml2db** feature!

Webservice implementation in Antelope

- Testing on Antelope 5.12:
 - Wildcard usage is not standard
 - *HN** returns HNN channel only
 - *HN?* is not recognized
 - *.** is used instead of ***
 - Some more optional keywords would be useful
 - *format* keyword for station/service
 - **dbcentral(1)** can be used to handle multiple databases, but they must refer to the same *dbmaster*

The screenshot displays the Antelope FDSN Server web interface. At the top, it shows the server name "Antelope FDSN Server" with a version indicator "1.0 OAS" and a logo. Below this, there are links for "OGS - Website" and "Send email to OGS". A "Servers" dropdown menu is set to "ifdsnws". The interface is organized into sections: "Station" (Information on stationxml data), "Data Select" (Information on dataselect data), "Event" (Information on event data), and "Schemas". Each section contains a list of endpoints with their respective HTTP methods (GET or POST) and return types. The "Data Select" section has a POST endpoint highlighted in green. The "Schemas" section shows a "DataSelect" link.

Method	Endpoint	Return Type
GET	/station/1/application.wadl	
GET	/station/1/query	.return:
GET	/station/1/version	
GET	/dataselect/1/application.wadl	
GET	/dataselect/1/query	.return:
POST	/dataselect/1/query	.return:
GET	/dataselect/1/version	
GET	/event/1/application.wadl	
GET	/event/1/catalogs	.return:
GET	/event/1/contributors	.return:
GET	/event/1/query	Information on event data
GET	/event/1/version	

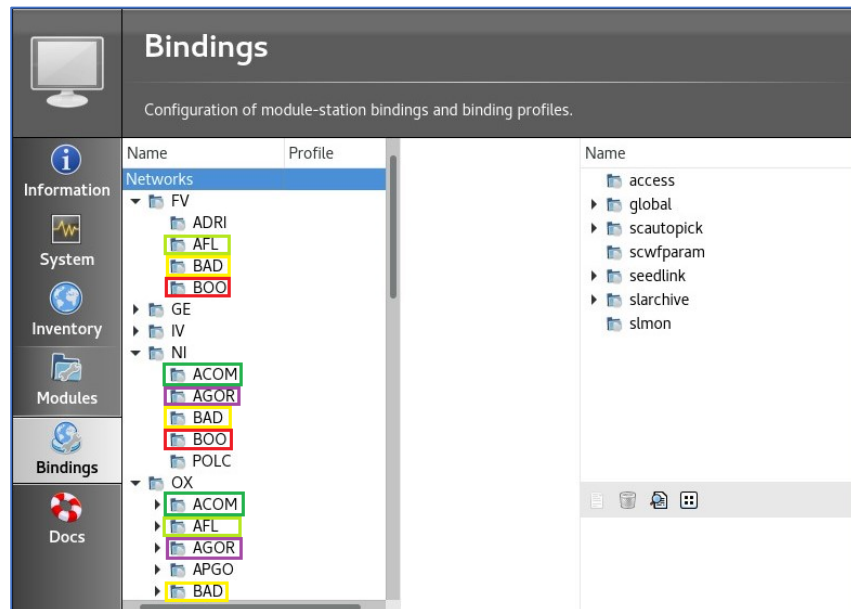

Webservice implementation in SeisComP

- [Data export](#) handled by **fdsnws** module, supporting all four FDSN services (station/, event/, dataselect/ and availability/)
- [Data import](#) handled by different utility modules, e.g.:
 - **import_inv** for station metadata (supports dataless SEED, FDSN StationXML, Arclink XML and SeisComP XML formats)
 - **slarchive** for time series data
 - (**ql2sc** for event data)

Webservice implementation in SeisComP

- Testing on SeisComP:

- Some useful optional features are already implemented
- Can serve additional waveform archives even if they are not part of the database
 - the database can manage stations with conflicting names (e.g.: stations from NI network, turned to OX network in 2016)

[Parent Directory](#)

SeisComP FDSNWS Station Web Service

The station Web service provides access to network, station, channel and response metadata in [FDSN Station XML](#) format. The metadata may be filtered e.g. by geographic region and time, also the information depth level is selectable. The request type is *HTTP-GET*. Please refer to <http://www.fdsn.org/webservice> for a complete service description.

Available URLs

- [query](#)
- [version](#)
- [application.wadl](#)
- [builder](#)

Feature Notes

- back-end software: [SeisComP](#)
- *matchtimeseries* request parameter only available if dataavailability information is enabled via configuration
- *updatedafter* request parameter not implemented: The last modification time in SeisComP is tracked on the object level. If a child of an object is updated the update time is not propagated to all parents. In order to check if a station was updated all children must be evaluated recursively. This operation would be much to expensive.
- additional request parameters, effective only for xml output:
 - *formatted*: boolean, default: *false*
- additional values of request parameters:
 - *format*
 - standard: [xml, text]
 - additional: [fdsnxml (=xml), stationxml, sc3ml]
 - default: xml

A Webservice user/provider wishlist

- Full implementation of all basic FDSN services and their features
- Additional implementation of some additional features useful for database management, e.g.:
 - (for data export) availability of multiple formats
 - (for data import) dedicated modules capable of translating input files from many formats
- Capability to serve multiple databases and to smartly handle request redirections
