aq

auto

review

product

archive

export

acquisition

- q3302orb
- orb2orb
- slink2orb – statefile not working
- rtp2orb
- emsc2db and such

automatic processing

- orbassoc – duplicate events
- orbevproc – homegrown magnitude
- manual review
- orbwfmeas

manual review

- dbloc2 – rely on plugins
- dbpick – no time for traceview

products

- alerts / bulletins
- shakemap
- macroseismic processing
- evinfo
- miniseed required for most ObsPy based stuff

archive

- orb2wf
- link_SDS
- pqlx / ObsPy

export

- bulletins
- orbserver / ringserver
- webservice

split_pf

- split data acquisition / data exchange into different instances
- sorts by expressions on site table (lat, lon, distance, name)
- only a subset of stations is affected during failures / maintenance
 - orb2orb (connections)
 - q3302orb (dataloggers)
 - slink2orb (stalist)
 - rtexec (slink2orb)
- supports backup connection (alternate path to datalogger)

sort_pf

- sorts by expressions on site table (lat, lon, distance, name)
 - orbrtd
 - orbmonrtd_dep
 - rtd soon

dlmon

reb2db

- new default schema css3.1 to allow for large (arrival) IDs used at CTBT
- few other changes to follow format specifications used at CTBT
- unfortunately, databases in css3.1 cannot be used with dbloc2

db2orbpf - python script to export databases to an orb

- similar to dbevent2orb / dborigin2orb
- database format changes possible
- can be called from within dbloc2

we still use our homegrown support for non-seismic data from CTBT

- ctbmet2db
- ctbtrrr2db
- ctbtxmlrrr2db
- support for mail_parser (import handlers)
- schema ctbto1.2 with tables for arr/rrr/met

emsc2db / usgs2db

- -p proxy (default per requests library is to use env variables)
- orb output
 - -P prefix
 - -o <prefix>/db/<table> to orb
 - -O <prefix>/pf/orb2dbt to orb
 - -s schema
 - -A archive everything (like dborigin2orb)
 - -B write magnitude to origin.mb, helps with orb_quake_alarm

fdsntxt2db

- retrieve event information from FDSN-like servers supporting only text format (e.g. INGV)

gfzrss2db

- some datacenters do not yet provide FDSN-like event information

ObsPy bindings for Antelope

Motivated by the availability of legacy data

2 libraries for import / export, written in Python

(obs2py2db / db2obs2py)

still unclear if it should be object-oriented

metadata not yet supported

simple but effective scripts for import and export

gives immediate access to all formats supported by ObsPy

current version saves waveforms to miniseed only

SEISAN format for station metadata not supported,

simple import tool added

still some work needed – help is appreciated!

archive

- save waveforms with orb2wf (~40G daily)
- db2msd after 5 days
- nightly cronjob to archive
- duplicate waveforms on second computer (~1 month)

QC

- overview plots with ObsPy
- PPSD with ObsPy
- monitor age and size of archive with nagios
- monitor IDs with Nagios (overflow of wfid)

send_alerts - Python script to distribute automatic lo alarms and updates

- relies on **dbnew2orb** for data transport
- initial location produced on one machine
- manual review on opter computer(s)
- all combined into one database

orb2dbt -overwrite

- check if alarm criteria match

write to alarm table

or

- this is an update
of an event found in the alarms table
→ send update

- use *evid* to identify event
- therefore we need a central idserver

Python script to distribute press releases

- checks felt reports
- template adjusted according to
 - location, time
 - magnitude
 - pseudo-intensity
- saves report in alarm table
- uses alternate template for
 - facebook – copy text to clipboard
 - twitter – tweet directly
- *table alarms* used

for various other purposes

-----Bisherige Meldung -----
 Der Österreichische Erdbebendienst
 (GeoSphere Austria) meldet:

Am Pfingstmontag, den 29. Mai 2023 ereignete sich um 18:46 Uhr
 bei Gloggnitz in Niederösterreich erneut ein Erdbeben der Magnitude 3.2.
 Dieses Beben, ebenso wie das Beben heute Nacht, wurde in der Umgebung deutlich verspürt.
 Es kann bei dieser Stärke vereinzelt zu leichten Schäden kommen.

Verfasser: Nikolaus Horn/Seismologe
 -----Bisherige Meldung -----
 Der Österreichische Erdbebendienst
 (GeoSphere Austria) meldet:

Am Montag, den 29. Mai 2023 ereignete sich um 18:46 Uhr
 im Raum Gloggnitz, Österreich ein Erdbeben der Magnitude ml3.2.
 Schäden an Gebäuden sind keine bekannt und bei dieser Stärke nicht zu erwarten.

Verfasser: Nikolaus Horn/Seismologe

Erdbeben in Österreich Niederösterreich erdbeben-meldung@zamg.ac.at,berel Senden?

☒ Link? ☒ Bitte? ☐ Twitter?

Facebook Vorlage Twitter

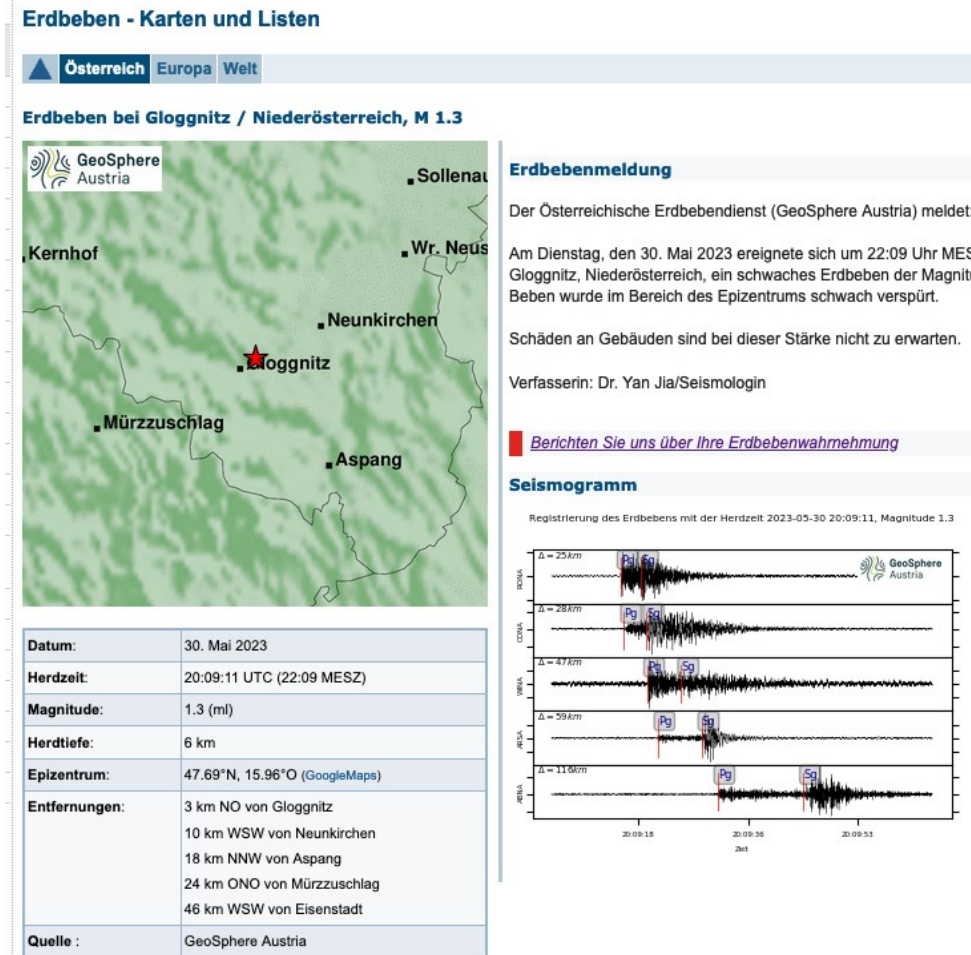

Python script to send tweets based upon python-twitter

- adds link to website with event details
- image recycled from website
 - uses „requests“ to check if image already present on website
- template adjusted according to
 - location
 - magnitude
 - pseudo-intensity
- no interaction needed

still based on dbrecenteqs

- static image produced with gmt
- waveforms from up to 5 austrian stations
- optional press release
- different databases for
 - nearby cities
 - cities and regions for maptitle
 - cities on different zoomlevels
- links on main site

motivation

- proper support of german ümlauts needed
- some links are long and/or ugly
- smoothen transition from ZAMG to GeoSphere Austria
- outlook sometimes a bit strange

new Python library to send emails with embedded links **zamg.mailutils**

- based on Python libraries preinstalled with Antelope
 - smtplib
 - email.mime
 - email.header
- text version optionally produced from html version
- optionally one email per recipient
- separator for multiple recipients configurable
- setup from site.py can be overridden in parameter file

Der Österreichische Erdbebendienst
(GeoSphere Austria) meldet:

Am Dienstag, den 30. Mai 2023 ereignete sich um 22:09 Uhr MESZ bei Gloggnitz, Niederösterreich, ein schwaches Erdbeben der Magnitude 1,3. | verspürt.

Schäden an Gebäuden sind bei dieser Stärke nicht zu erwarten.

Verfasserin: Dr. Yan Jia/Seismologin

Die aktuellen Informationen über das Ereignis finden Sie auf der [Website](#) des Österreichischen Erdbebendienstes.

Der Erdbebendienst ersucht die Bevölkerung um Rückmeldung betreffend die Auswirkungen des Erdbebens über eine der folgenden Möglichkeiten:

· [Web-Formular](#)

· App [QuakeWatch Austria](#)

· Post an folgende Adresse (Porto zählt Empfänger):

Online database query
If a query makes sense or not depends on the database: only oew1/oew2 have region information. For all other databases, region subsetting is ignored. Subsetting on magtypes is supported, but the magnitude displayed is selected by reliability (mw highest, md lowest). Oew1/oew2 are the original databases. All other databaes reside in /geodata/db. OEW is the production database e.g as seen for map production. VGS ist the output of the realtime location system. Other database names should speak for themselves.

fast interactive query
very fast thanks to cached geographical search

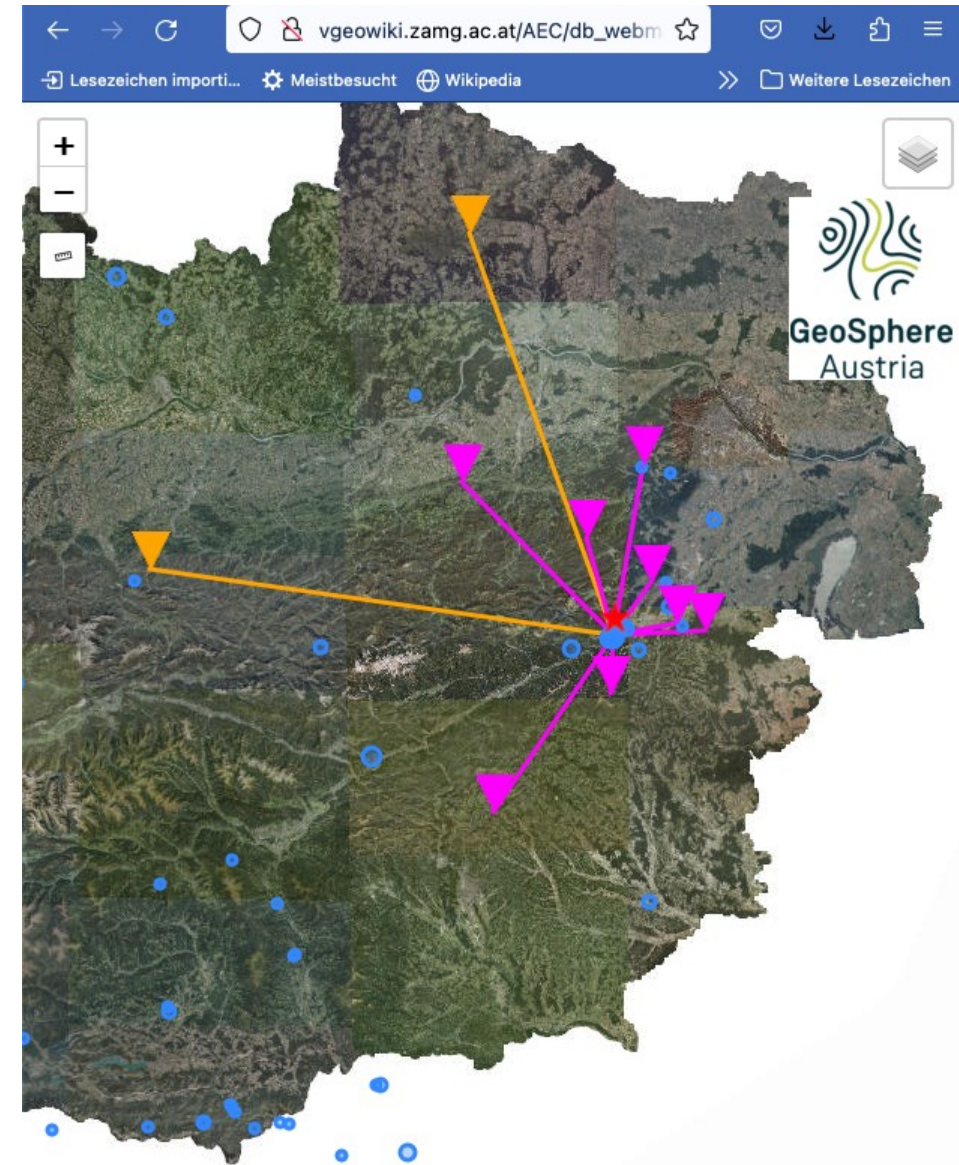

output formats

- table
- Excel (xlwt, some bizarre problems fixed)
- CSV
- homegrown interactive map based on leaflet
 - easy to embed external webservice
- JavaScript libraries **Data Tables** and extension **Buttons** → PDF, CSV, Excel, printer, clipboard

webdbevents

CGI based alternative to dbevents

- webserver needed
- webserver needs to have access to database
- overlays easy to embed
- various maps
- ruler
- dbloc2 plugin to open URL in browser: dbopen_url

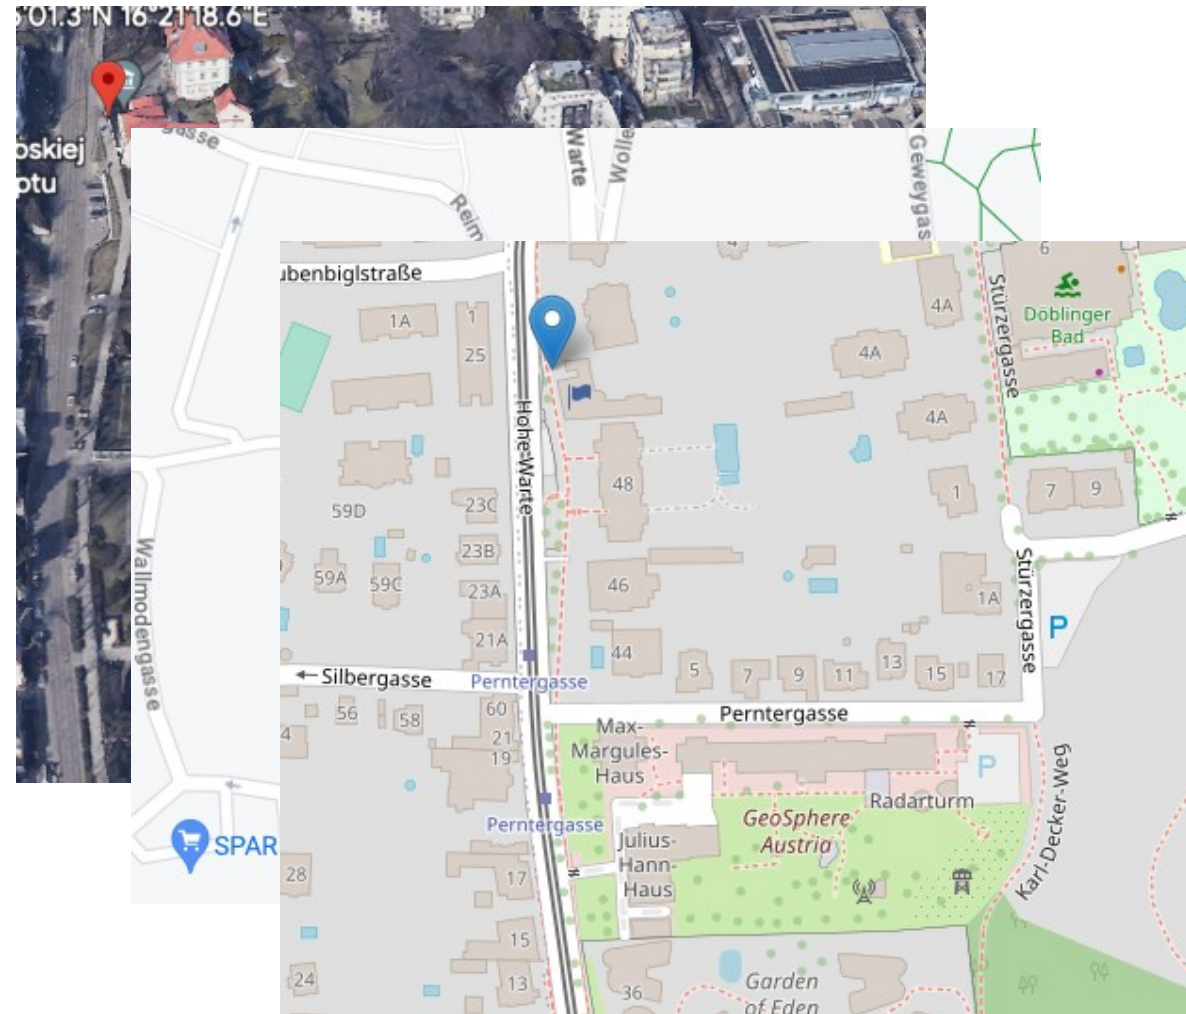

dbopen_url

to be called from

- commandline
- dbe
- dbloc2

default parameterfile comes with templates for

- earth.google.com
- www.google.com/maps
- www.openstreetmap.org

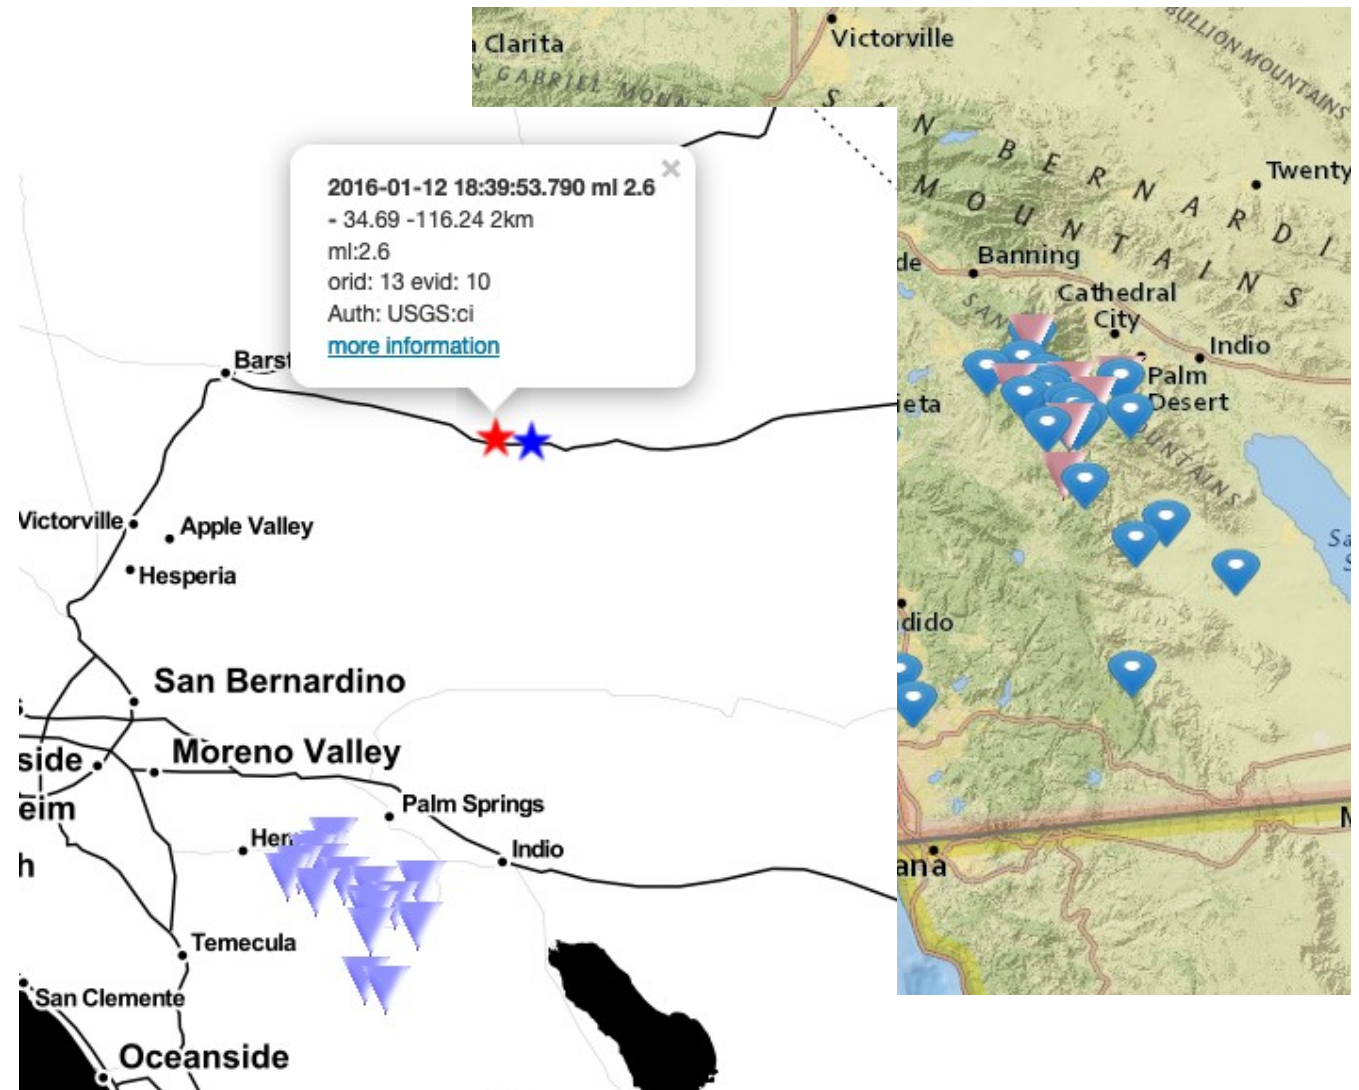

interactive webmaps based on leaflet
java script libraries via CDN
symbols courtesy GeoSphere

web_stamap

- group stations by search expression

web_evmap

- stations used
- all stations
- event information for prefer on separate page

five+ years mobile app

display events

- our data data provided with FDSN-like webservice (JSON)
- delete events by setting special etype
- data from our website transferred to webserver via dbnew2orb

collect felt reports

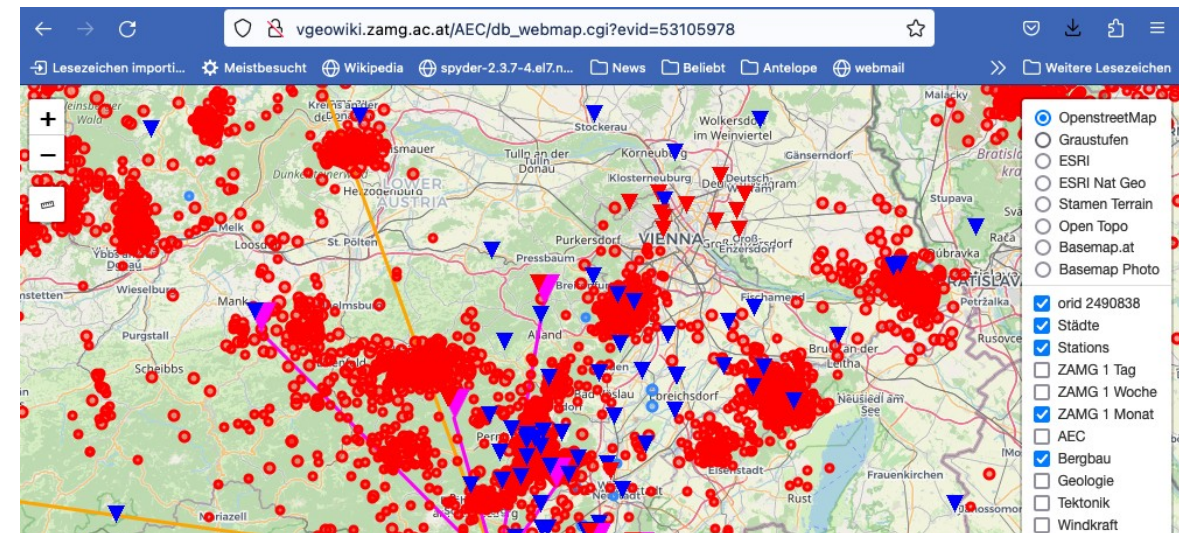

- data provided to us as webservice
- distributed via orb

homegrown FDSN-webservices

- Python modules cgi, cgitb, json, xml.dom, xml.etree
- event – QuakeML, JSON
- station – stationXML, text. db2stationXML not really flexible
- dataselect – diskpace on server an issue

JSON-files as background layers for webmaps

- station
- events
- measurements
- macroseismic data

pydoc disappeared some versions ago

but there's help: *python -m pydoc*

the Python interface crashes when reading NON-UTF8 strings

need to iterate over all fields

ttgrid_show had disappeared

but there's help: ttgrid_info should do the same

orbassoc not trivial with variable station density

slink2orb needs fixes

my life is easier with references in parameter files

```
User  &Arr{  
Institution  &ref(site,Institution)  
arrival_menu_items &ref(dblloc2,User{arrival_menu_items})
```

would be nice to have support for references in pfe

interested?
repo with internal stuff open upon
request!
